CAP5619 - Assignment 2 - LLM Document Analysis

The LLM Document Analysis assignment was very difficult for me. At first it seemed straightforward, and the information was much easier to understand after learning about the LLM analysis process in this class. Ironically, because I had a better grasp of the concepts, I mistakenly believed I would be able to finish it more easily than the previous work. Instead, it ended up being one of the hardest assignments because of the volume of data needed to meet the requirement of 100 entries.

The volume of data could not be processed on my laptop, so I tried using links within my script to pull the data directly from the SEC. However, I could not get this method to work correctly at first..

Next, I downloaded the API files for Nvidia, Microsoft, and Apple to see if they would provide the data I needed to test my script. In doing so, I discovered errors in my initial code that were difficult to figure out, which made it hard to move on to the next step of the assignment.

Finally, I was able to use a hybrid approach that combined direct SEC links with Ollama, which helped me download the information through my terminal. I analyzed over 100 entries.

The next step was uploading the data to GitHub. This was tricky because I am still becoming accustomed to uploading to the website rather than just viewing the information other users share. Even so, it felt good to accomplish.

My overall takeaway from this assignment is how challenging it is to work with large LLMs and large datasets in general. My relatively new laptop froze, ran out of memory, and shut down without warning. I had not realized how heavily the processing would tax my computer’s resources. That said, overall, this assignment has been a useful learning experience.
